

MICHAEL PARKER

Software Engineer · Full-Stack .NET & Blazor

Murrysville, PA | (724) 953-6952 | mjp5840@gmail.com

PROFESSIONAL SUMMARY

Full-stack software engineer with 7+ years building production .NET and Blazor systems, specializing in secure third-party integrations, scalable architecture, and dependable delivery from design through release. Operates a fully agent-driven development workflow — Claude Code as the primary build loop, with independent cross-model review before merge — raising throughput without relaxing the quality bar.

AGENTIC DEVELOPMENT & AI ENGINEERING

- **Agent-driven build loop:** Runs Claude Code as the primary development workflow across production .NET/Blazor repositories — planning, implementation, test coverage, and pull requests are executed through the agent rather than alongside it.
- **Custom agent tooling:** Builds subagents, skills, hooks, and repository-level conventions encoding architecture rules, coding standards, and review checklists, so agent output conforms to the codebase instead of requiring rework.
- **Cross-model adversarial review:** Uses Codex as an independent reviewer of Claude-generated changes before merge, surfacing regressions, edge cases, and faulty assumptions that single-model self-review consistently misses.
- **MCP tool integration:** Wires MCP servers and custom tooling into the agent loop, giving agents direct access to databases, APIs, and internal systems so changes are made against real context rather than inference.

PROFESSIONAL EXPERIENCE

Software Engineer | Matthews Aurora Funeral Solutions

Dec 2024 – Present

- Build and maintain production services, integrations, and UI on a large-scale Blazor and .NET platform, working across front-end, back-end, and data layers to carry features from design through release.
- Led the implementation of secure OAuth 2.0 integrations with QuickBooks and PayPal, automating synchronization of invoices, payments, and financial records that previously depended on manual reconciliation.
- Design and harden REST APIs and Entity Framework Core data access so integrations degrade gracefully under third-party outages, token expiration, and partial failures rather than corrupting financial state.
- Deliver features through an agentic workflow built on Claude Code, with Codex performing adversarial review ahead of merge — sustaining higher feature throughput while keeping human review focused on architecture and risk.
- Collaborate across multiple project teams to improve system reliability, maintainability, and deployment workflows, contributing to code review and shared engineering standards.

Application Development Specialist | True Helix

Oct 2021 – Dec 2024

- Built a client scheduling, employee tracking, and payroll web application in Blazor and .NET/C#, owning features from requirements through production support.
- Expanded onto the mobile team to deliver shift management features in a Xamarin.Forms application, and integrated React components to improve functionality and user experience across web and mobile.
- Implemented caregiver scheduling logic that reduced manual coordination for operations staff.

Software Engineer | Westmoreland Mechanical Testing and Research

Mar 2019 – Oct 2021

- Migrated 125 legacy programs from Visual Basic 3/4 to Visual Basic 6 and built internal testing tools, including a CRUD application for furnace test management — improving system stability and streamlining lab data handling.
- Led recovery efforts during two data breach incidents, coordinating with IT to restore data integrity and establish more robust backup and recovery protocols.

TECHNICAL SKILLS

Languages & Data: C#, TypeScript, SQL, Visual Basic, SQL Server, Entity Framework Core, LINQ

Web & Frameworks: Blazor, .NET / .NET Core, REST APIs, React, Xamarin.Forms

Integrations & Auth: OAuth 2.0, QuickBooks API, PayPal API

Agentic & AI Tooling: Claude Code, Codex, MCP servers, custom subagents / skills / hooks, context engineering

Tools & Practices: Git, code review, CI and deployment workflows
